ACKNOWLEDGEMENT

Primarily I'd thank god for being able to complete my project with success. Then I'd like to thank my mentor **Ms. Komal Arora**, whose valuable guidance has been the ones that helped me patch this project and make it full proof success in contribution towards the completion of this project.

Last but not least I'd rather thanks to **Lovely Professional University**, and my parent's inspiration, who gave me this golden opportunity to learn many new things, to learn another aspects of life.

ANALYSIS

INTRODUCTION

- Data management is important because the data your organization creates is a very valuable resource.
- The last thing you want to do is spend time and resources collecting data and business intelligence, only to lose or misplace that information.
- In that case, you would then have to spend time and resources again to get that same business intelligence you already had.
- And on that data analysis is carried out which show visualization of our problems in efficient way.
- Data Analysis is a process of inspecting, cleansing, transforming, and modeling data with the goal of discovering useful information, informing conclusions, and supporting decision- making.
- This project is based on such data analysis on Shoes in India and sales in every city of each brand

OBJECTIVES/SCOPE OF ANALYSIS

After analysis of the dataset, the aim of this project is to give answer of given objectives in easy way:

- Top 10 State wise sales Report
- Top 5 city wise sales report
- Region wise sales of each brand
- Total quantity sales of each brand
- Top 5 month sales of shoes

ETL

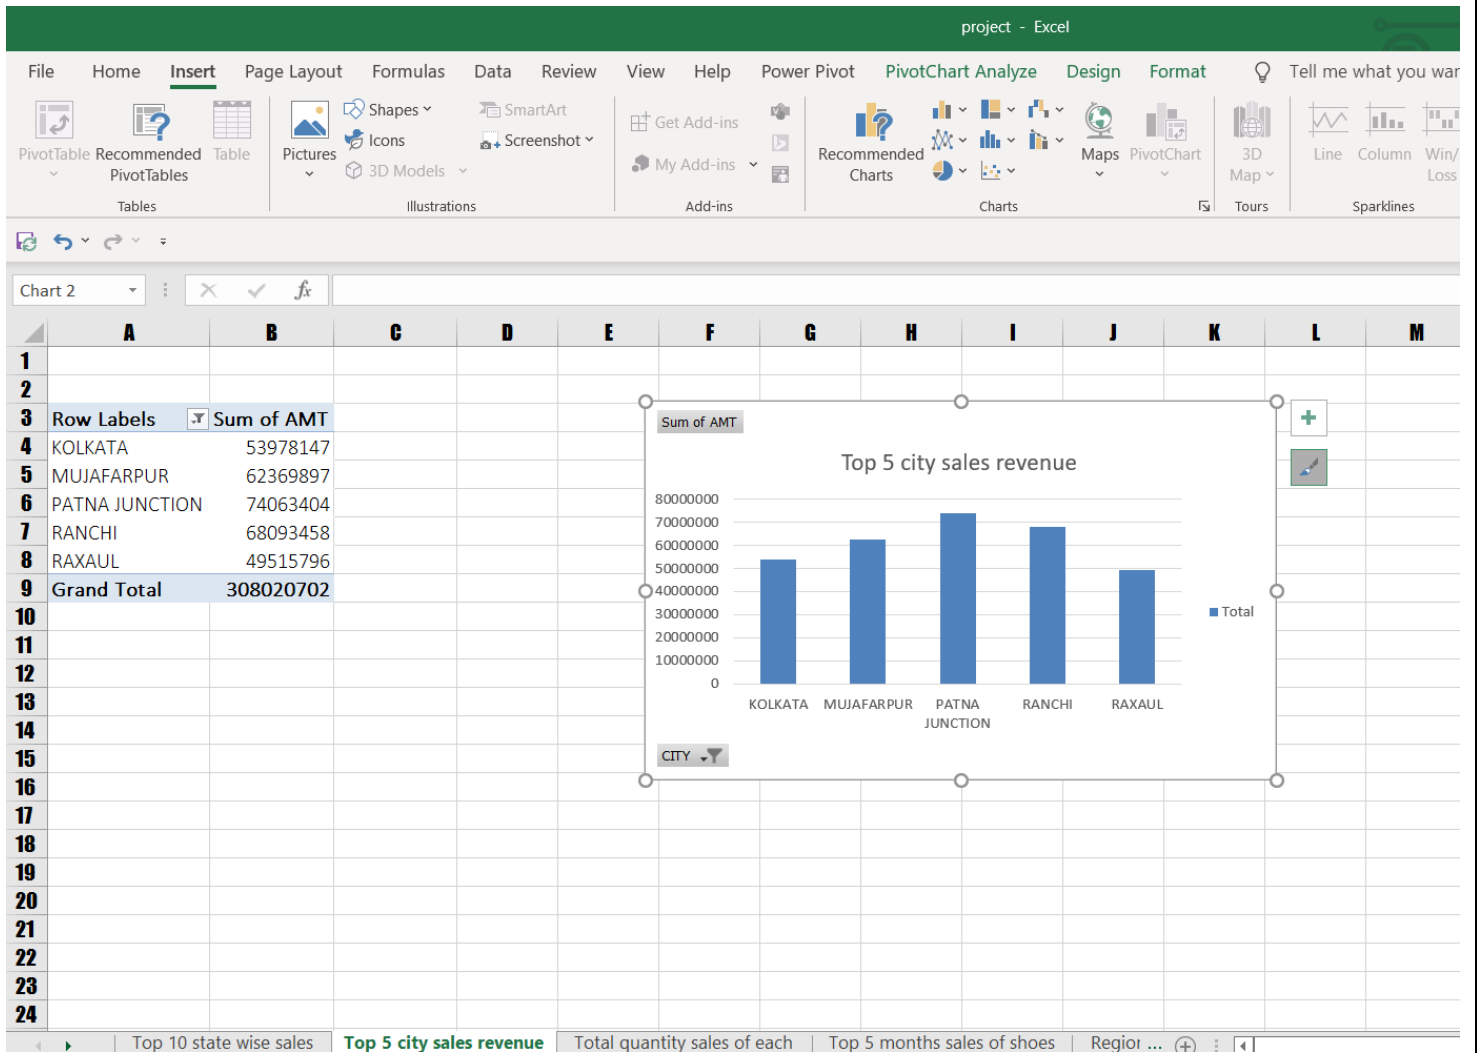

- **ETL** is a process that extracts the data from different source systems, then transforms the data (like applying calculations, concatenations, etc.) and finally loads the data into the Data Warehouse system.
- Full form of ETL is Extract, Transform and Load.
- The triple combination of ETL provides crucial functions that are many times combined into a single application or suite of tools that help in the following areas:
 - Enhances Business Intelligence solutions for decision making.
 - Allows verification of data transformation, aggregation and calculations rules.
 - Allows sample data comparison between source and target system.
 - Helps to improve productivity as it codifies and reuses without additional technical skills.
